Most crypto products break in the same place — the moment *real money moves* through code nobody stress-tested. I write the parts that cannot fail.

On Nest that means ERC-721 factory contracts with reentrancy guards and pull-payment accounting, over a Fastify and PostgreSQL backend whose indexer stores the hash of the block it last read — so a reorg rewinds and replays instead of losing a mint. Before the contracts came five ecosystems of Discord and Telegram rooms, which is where the instinct for building things that hold under load comes from.
